Building Quality and Security into Financial IT Systems

Financial institutions rely on technology and innovation to deliver a competitive edge and to comply with the stream of new regulations and changing processes imposed upon them. To keep pace, IT departments are developing new applications and enhancing existing systems to ensure their organizations stay ahead but deploying new functionality in a complex technical environment brings risks and can cause significant damage when not managed well. Failures in business critical systems and breaches of security can have a substantial and long-term impact on financial institutions.

When done well the verification and testing of financial applications can not only reduce the risk of failures in business critical systems but delivers systems with improved quality that can be deployed faster, saving time and money. It is too late to wait until after development to uncover problems in test - quality should be built into applications throughout the development lifecycle.

Many organizations focus their security investments on perimeter defences such as firewalls and intrusion detection and prevention systems. Unfortunately this network-biased approach, while an important part of a security architecture, isn't sufficient. The majority of malicious attackers target the applications to outwit perimeter defences. This means security can be breached if applications are not designed, developed and tested to defend themselves. Security needs to be built into applications throughout the development lifecycle if critical data and systems are to be protected effectively.

How We Can Help

TVS is a specialist test and verification company bringing many years of expertise in verifying and testing business, mission and safety critical software, hardware and systems to the financial services sector. We can:

- Help you improve your verification and test processes to deliver higher quality, more secure applications
- Exploit test automation to speed up testing and reduce costs
- Provide a flexible onsite/offshore cost-effective test capability to support your application testing
- Help you introduce effective application security testing into your test/QA teams
- Ensure your designers and developers know how to build security controls into your applications
- Carry out cost-effective and enhanced penetration testing of your externally visible applications
